

Universal Declaration of Organic Rights of 2025

Marie Seshat Landry

Tuesday 18th February, 2025

Preamble

Recognizing that all organic life—human, animal, plant, and microbial—is interconnected and essential to the balance of ecosystems, and acknowledging that the well-being of humanity is inseparably tied to the health of the natural world,

Affirming that the rights of living beings and ecosystems must be upheld to ensure sustainability, diversity, and the continuation of life for future generations,

Inspired by the wisdom of indigenous cultures, scientific understanding, and ethical traditions that regard nature as a living entity deserving of respect and protection,

We, the signatories of this declaration, proclaim the following **Universal Rights of Organic Life** and call upon all individuals, institutions, and nations to honor and uphold them.

Article 1: The Right to Exist and Thrive

All organic life forms, including humans, animals, plants, and microorganisms, have the inherent right to exist, flourish, and evolve without unjust destruction or exploitation.

Article 2: The Right to a Clean and Healthy Environment

Every living being has the right to clean air, unpolluted water, fertile soil, and a balanced climate that supports life. Governments and individuals must prevent environmental degradation and restore ecosystems where damage has occurred.

Article 3: The Right to Biodiversity and Natural Balance

Biodiversity must be preserved as a fundamental pillar of planetary health. The destruction of species, genetic modification without ethical considerations, and the disruption of ecological balance are violations of this right.

Article 4: The Rights of Ecosystems

Forests, rivers, oceans, and other natural systems have the right to exist, regenerate, and sustain themselves. Their integrity must be legally protected against deforestation, pollution, and overexploitation.

Article 5: The Rights of Indigenous Knowledge and Stewardship

Indigenous peoples, as guardians of many of the world's ecosystems, have the right to protect their traditional ecological knowledge, lands, and ways of life. Their wisdom must be respected and integrated into global environmental governance.

Article 6: Ethical Treatment of Animals

Animals, both wild and domesticated, have the right to live free from cruelty, unnecessary suffering, and extinction. Industrial practices that cause mass suffering must be reformed to align with ethical and ecological principles.

Article 7: The Responsibility of Humanity

Humans, as conscious stewards of the planet, have a duty to respect and protect organic life. This includes shifting toward regenerative agriculture, sustainable industries, and environmental justice policies.

Article 8: Legal and Political Implementation

Nations and governing bodies shall incorporate these rights into their legal frameworks, ensuring the protection of organic life through enforceable laws, conservation efforts, and international cooperation.

Article 9: Cultural and Spiritual Recognition of Nature

The intrinsic value of nature must be recognized not only legally but also culturally and spiritually. Societies are encouraged to foster traditions, philosophies, and practices that honor the sacredness of life.

Article 10: Future Generations' Right to a Thriving Planet

Future generations have the right to inherit a planet capable of sustaining life. This declaration obligates present generations to make decisions that prioritize long-term ecological health over short-term gains.

Final Provisions

This declaration serves as a guiding framework for global policies, ethical standards, and grassroots movements advocating for ecological justice. It calls upon the international community, governments, organizations, and individuals to adopt, enforce, and promote these rights to ensure a just and sustainable future.

Conclusion

The **Universal Declaration of Organic Rights of 2025** seeks to redefine our relationship with nature—not as masters, but as co-inhabitants and caretakers. By adopting and upholding these principles, we honor the fundamental truth that all life is interconnected, and we commit to protecting the natural world for generations to come.
